Artificial Intelligence

Neural Networks

Stochastic Gradient Descent

Function:

$$J(\theta_1, \theta_2) = \theta_1^2 + \theta_2^2$$

Objective:

$$\min_{\theta_1, \theta_2} J(\theta_1, \theta_2)$$

Update rules:

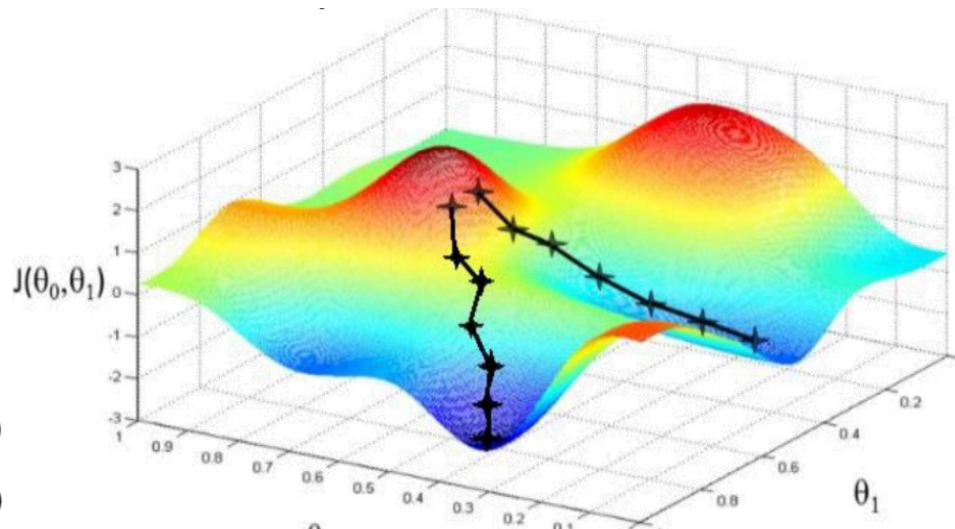

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1, \theta_2)$$

$$\theta_2 := \theta_2 - \alpha \frac{d}{d\theta_2} J(\theta_1, \theta_2)$$

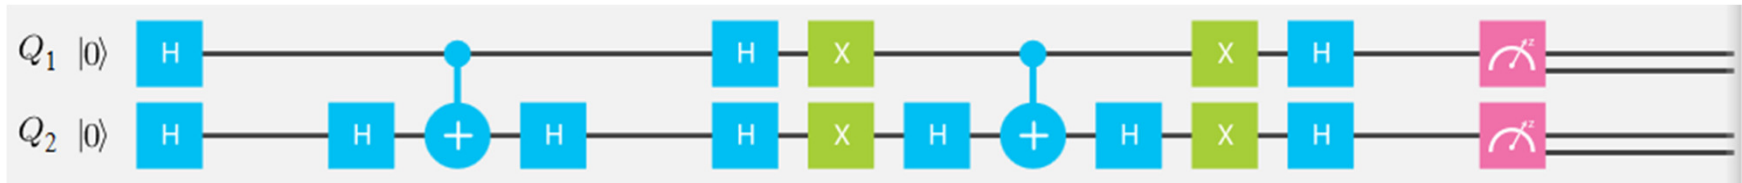

Derivatives:

$$\frac{d}{d\theta_1} J(\theta_1, \theta_2) = \frac{d}{d\theta_1} \theta_1^2 + \frac{d}{d\theta_1} \theta_2^2 = 2\theta_1$$

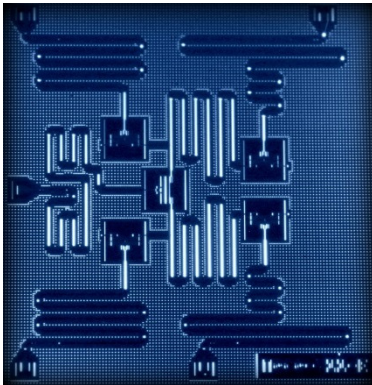

$$\frac{d}{d\theta_2} J(\theta_1, \theta_2) = \frac{d}{d\theta_2} \theta_1^2 + \frac{d}{d\theta_2} \theta_2^2 = 2\theta_2$$

Quantum Computing

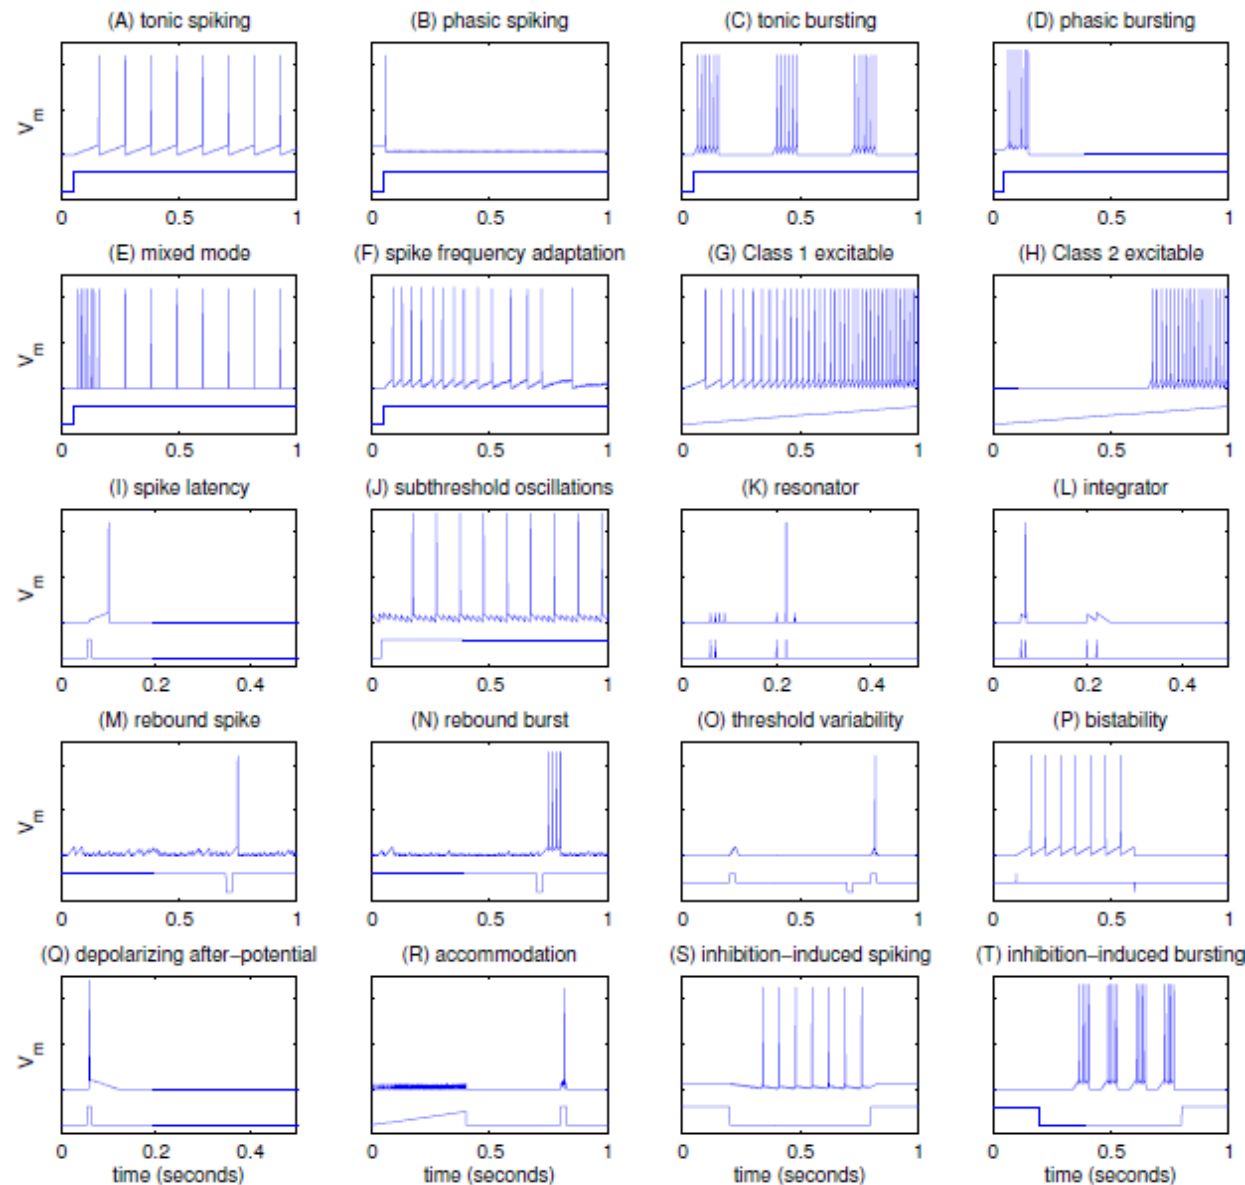

$$|0\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad |1\rangle = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

Spiking Neurons

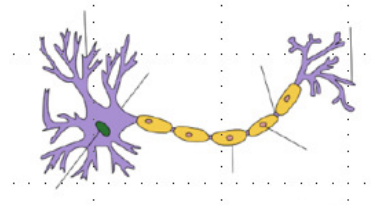

Prominent Features of Spiking Neurons after Izhikevich

Neuron Function

- Emulation of analog behaviour by +/- 255 INT variable
- 2-dimensional on-chip synaptic weighted network and off-chip packet based thru-neuron routing for multi-chip scaling
- Update of Synaptic network every ms (logical / biological clock), internal processing ~ 1MHz
- Neuron fires a spike (45 pJ) to the network if in the last update cycle a threshold was reached or exceeded
- Stochastic and leak behaviour configurable

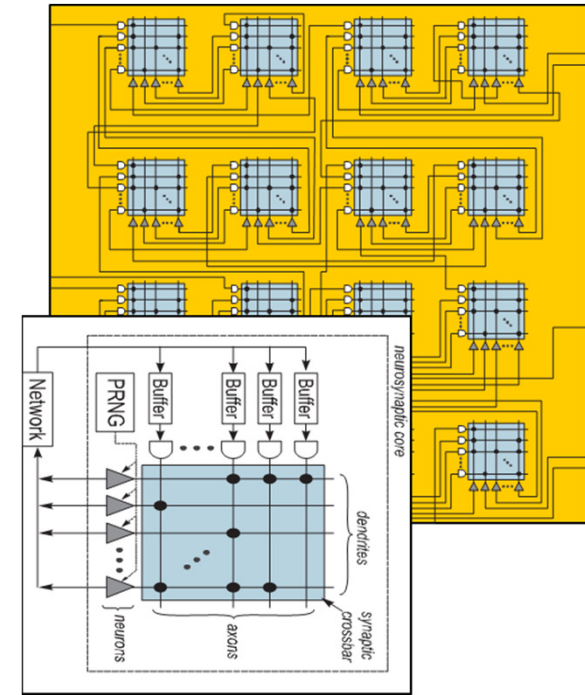

Membrane potential for neuron j at time t

$$V_j(t) = V_j(t-1) + \sum_{i=0}^{255} A_i(t) * z_{ij} * [(1 - b_j) * s_j + \text{sign}(s_j) * b_j * F(|s_j|, q_j)] + \text{Leak}$$

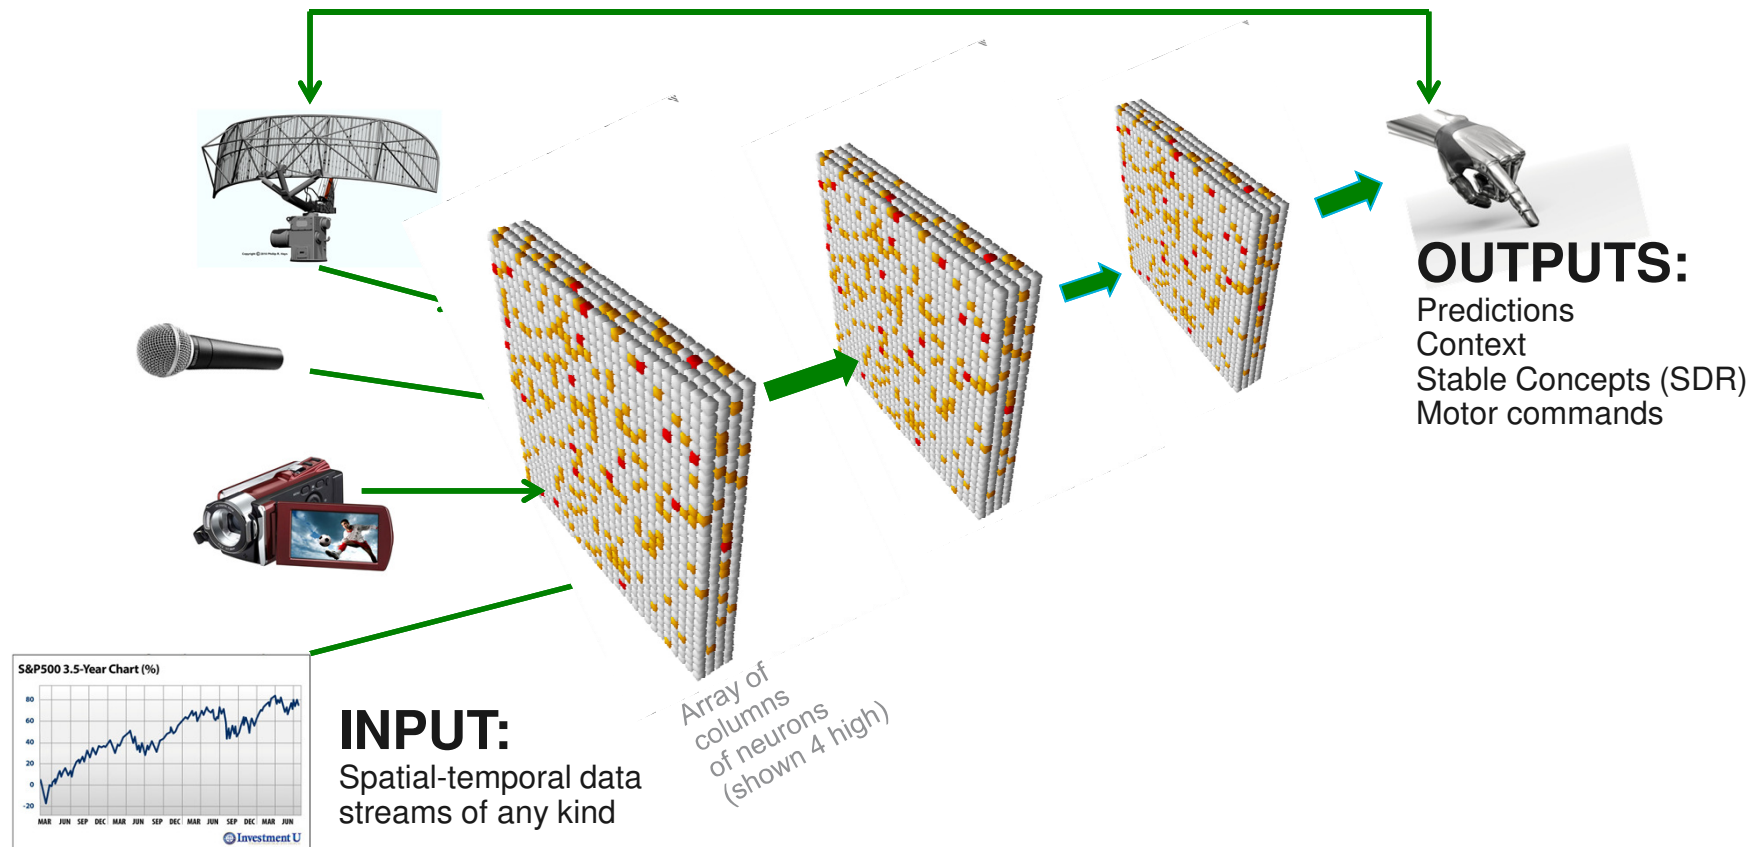

Leak

$$V_j(t) = V_j(t-1) + \begin{pmatrix} +1 \\ 0 \\ -1 \end{pmatrix} * [(1 - c_j) * k_j + \text{sign}(k_j) * c_j * F(|k_j|, q_j)]$$
