# Efficient Checkpointing in Byzantine Fault-Tolerant Systems

November 22, 2019

Michael Eischer, Tobias Distler

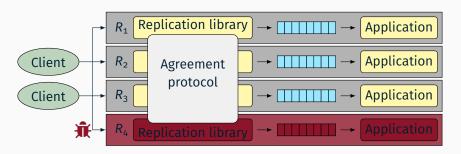

Friedrich-Alexander Universität Erlangen-Nürnberg (FAU)

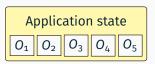

# Byzantine Fault-Tolerant State-Machine Replication

- Replicate service for fault tolerance
- Tolerate Byzantine (arbitrary) faults
- Application state consists of objects O<sub>i</sub> with unique object IDs

# **Request Processing**

	Request	Check-
	execution	<sub>I</sub> pointing
$R_1$	$O_1   O_1, O_3   O_3   O_1$	0 <sub>1</sub> ,,0 <sub>5</sub>
$R_2$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>
$R_3$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>
$R_4$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>
	time →	

■ Keep requests to tolerate faults

# **Request Processing**

	Request execution	Check- pointing	Request execution	Check- pointing
$R_1$	$O_1   O_1, O_3   O_3   O_1$	0 <sub>1</sub> ,,0 <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5$	O <sub>1</sub> ,,O <sub>5</sub>
$R_2$	$O_1   O_1, O_3   O_3   O_1$	<i>O</i> <sub>1</sub> ,, <i>O</i> <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5  $	<i>O</i> <sub>1</sub> ,, <i>O</i> <sub>5</sub>
$R_3$	$O_1   O_1, O_3   O_3   O_1$	<i>O</i> <sub>1</sub> ,, <i>O</i> <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5  $	<i>O</i> <sub>1</sub> ,, <i>O</i> <sub>5</sub>
$R_4$	$O_1   O_1, O_3   O_3   O_1$	0 <sub>1</sub> ,,0 <sub>5</sub>	$ O_2,O_3 O_1 O_5 O_1,O_5 $	<i>O</i> <sub>1</sub> ,, <i>O</i> <sub>5</sub>
	l time →			

- Keep requests to tolerate faults
- Collect garbage after checkpoint
- Create checkpoints at fixed interval

#### **Request Processing**

	Request execution	Check- pointing	Request execution	Check- pointing	
$R_1$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5$	0 <sub>1</sub> ,,0 <sub>5</sub>	$\checkmark$
$R_2$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5$	O <sub>1</sub> ,,O <sub>5</sub>	$\checkmark$
$R_3$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5$	<i>O</i> <sub>1</sub> ,, <i>O</i> <sub>5</sub>	$\checkmark$
$R_4$	$O_1   O_1, O_3   O_3   O_1$	O <sub>1</sub> ,,O <sub>5</sub>	$O_2, O_3   O_1   O_5   O_1, O_5$	O <sub>1</sub> ,,O <sub>5</sub> 🗼	×
	¹ time →			ı	

- Keep requests to tolerate faults
- Collect garbage after checkpoint
- Create checkpoints at fixed interval
- Unverified checkpoint might be corrupted
  - $\rightarrow$  Check for f + 1 identical checkpoint hashes

#### **Full Checkpointing**

	Rec	uest ex	ecut	ion	Checkpointing	Requ	est (	[Checkpointing]		
$R_1$	01	01,03	03	01	01,,05	02,03	01	05	01,05	01,,05
$R_2$	01	01,03	03	01	O <sub>1</sub> ,,O <sub>5</sub>	02,03	01	05	01,05	01,,05
$R_3$	01	01,03	03	01	01,,05	02,03	01	05	01,05	01,,05
$R_4$	01	01,03	03	01	01,,05	02,03	01	05	01,05	O <sub>1</sub> ,,O <sub>5</sub>
		time -	<b>—</b>							

- Copy every object
- Stop the world: Identical checkpoints
- Service not available during checkpointing

#### Differential Checkpointing<sup>1</sup>

	Request execution [Checkp.] Request execution					Checkpointing				
$R_1$	01	01,03	03	01	01,03	02,03	01	05	01,05	0 <sub>1</sub> ,0 <sub>2</sub> ,0 <sub>3</sub> ,0 <sub>5</sub>
$R_2$	01	01,03	03	01	01,03	02,03	01	05	01,05	01,02,03,05
$R_3$	01	01,03	03	01	01,03	02,03	01	05	01,05	$O_1, O_2, O_3, O_5$
$R_4$	01	01,03	03	01	01,03	02,03	01	05	01,05	01,02,03,05
		time -	_							

- Only copy changed objects
- Merge with full checkpoint afterwards
- Large objects / expensive state-retrieval still problematic

$R_4$	01	01,03	03	01	O <sub>1</sub> ,,O <sub>5</sub>	$0_2, 0_3$	01	05	01,05	03	02,01	02	04
		time –	-					$\overline{\mathbf{x}}$			K	_	ブ

- Infrequent full checkpoints
- Combine with log of requests
- Reexecution of request log for checkpoint application
  - Requests causing failures could trigger these again

<sup>&</sup>lt;sup>2</sup>Allen Clement et al. "UpRight Cluster Services". In: *Proc. of the 22nd Symp. on Operating Systems Principles.* 2009, pp. 277–290.

#### Sequential Checkpointing<sup>3</sup>

- Full checkpoints at different sequence numbers
- Not directly comparable
- Application of request log to recreate checkpoints
- Verification of checkpoint after state application

<sup>&</sup>lt;sup>3</sup>Alysson Bessani et al. "On the Efficiency of Durable State Machine Replication". In: *Proc. of the 2013 USENIX Annual Technical Conf.* 2013, pp. 169–180.

# Challenges

Checkpointing Method	Resilience	Efficiency
Full	$\checkmark$	×
Differential	$\checkmark$	0
Hybrid	0	0
Sequential Sequential	×	$\checkmark$

#### **Challenges**

Need for Byzantine fault-tolerant checkpointing mechanism that is

- Resilient: Validate checkpoint before applying
- **Efficient:** Low performance impact

#### **Table of Contents**

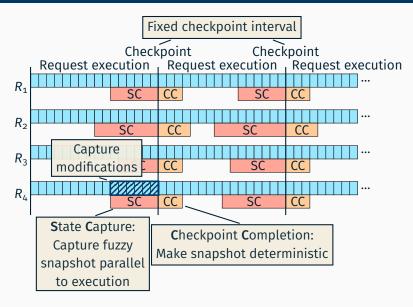

- 1. Motivation
- 2. Our Approach: Deterministic Fuzzy Checkpoints
- 3. Evaluation
- 4. Summary

# Our Approach: Deterministic Fuzzy Checkpoints

# Deterministic Fuzzy Checkpoints (DFC)

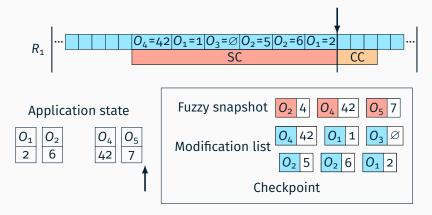

#### **State Capture**

- Capture state parallel to request execution
- Snapshots differ between replicas

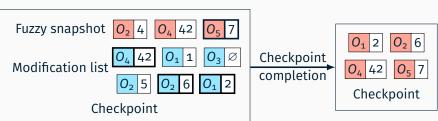

#### **Checkpoint Completion**

- Apply modifications to snapshot
- Creates an identical checkpoint on all replicas
  - Snapshot or modification list contain latest version of each object

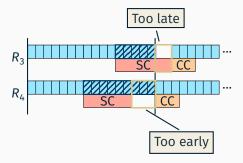

# **Capture Timing**

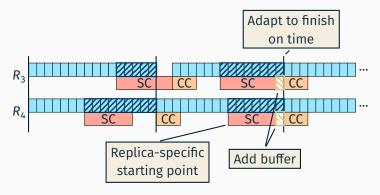

- Adapt starting point to finish on time
  - Goal: Minimize overhead
  - Account for capture time in sequence numbers
  - Add buffer time
- Adapt to heterogeneous server performance

## **Capture Timing**

- Adapt starting point to finish on time
  - Goal: Minimize overhead
  - Account for capture time in sequence numbers
  - Add buffer time
- Adapt to heterogeneous server performance

# Variant I: Copy after Write (DFC<sub>caw</sub>)

**Application interface** similar to BASE<sup>4</sup>

// Request execution
RESULT invoke(REQUEST r);
@Callback
void modified(OBJECTID oid);

// Checkpointing
BYTE[] object(OBJECTID oid);

- Replication library has access to individual state objects
- → Generic snapshot handling
  - State capture
    - Checkpointer thread collects copy of all objects
    - Modification list: At checkpoint sequence number copy final state of objects modified during state capture
  - Checkpoint completion
    - Keep latest version of an object

<sup>&</sup>lt;sup>4</sup>Miguel Castro, Rodrigo Rodrigues, and Barbara Liskov. "BASE: Using Abstraction to Improve Fault Tolerance". In: *ACM Trans. on Computer Systems* 21.3 (2003)

# Variant II: Updates (DFC<sub>upd</sub>)

#### **Application interface**

```
// Request execution
[RESULT, UPDATE] invoke(
    REQUEST r,
    BOOLEAN createUpd);
```

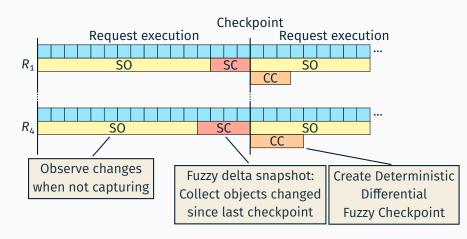

```
// Checkpointing
SNAPSHOT fuzzy();
```

```
// Completion
SNAPSHOT complete(
    SNAPSHOT s, UPDATE[] u);
```

- Content of UPDATES and SNAPSHOT is application-specific
- ightarrow Fine-grained modification tracking
  - State capture
    - Concurrent snapshot creation
    - Modification list: Library collects list of UPDATES
  - Checkpoint completion
    - Apply collected UPDATES

# Deterministic Differential Fuzzy Checkpoints (DDFC)

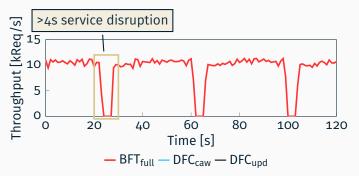

ightarrow Merge with latest full checkpoint for up-to-date full checkpoint

# Evaluation

## **Evaluation - Full Checkpoints**

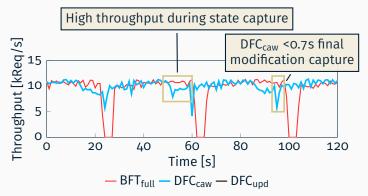

- Application: Key-value store with in-memory SQLite database
  - Application state 3GB (750k objects à 4kb)
  - Mixed read/write request on single entry
  - Checkpoint approximately every 400k requests
- Four replicas (4 cores, 3.6 GHz)
- 100 client instances on one server (12 cores, 2.4 GHz)

## **Evaluation - Full Checkpoints**

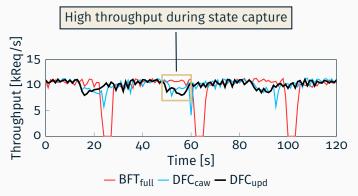

- Application: Key-value store with in-memory SQLite database
  - Application state 3GB (750k objects à 4kb)
  - Mixed read/write request on single entry
  - Checkpoint approximately every 400k requests
- Four replicas (4 cores, 3.6 GHz)
- 100 client instances on one server (12 cores, 2.4 GHz)

## **Evaluation - Full Checkpoints**

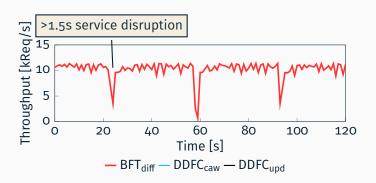

- Application: Key-value store with in-memory SQLite database
  - Application state 3GB (750k objects à 4kb)
  - Mixed read/write request on single entry
  - Checkpoint approximately every 400k requests
- Four replicas (4 cores, 3.6 GHz)
- 100 client instances on one server (12 cores, 2.4 GHz)

#### **Evaluation - Differential Checkpoints**

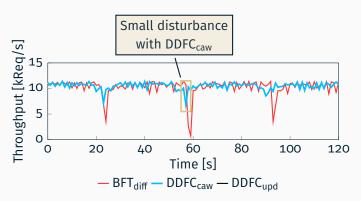

■ More than >200k changed objects

## **Evaluation - Differential Checkpoints**

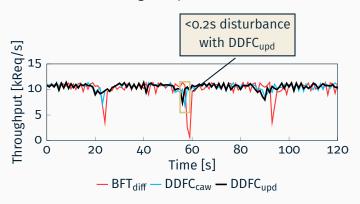

■ More than >200k changed objects

#### **Evaluation - Differential Checkpoints**

■ More than >200k changed objects

# Summary

#### **Summary**

Checkpointing Method	Resilience	Efficiency
Full	$\checkmark$	×
Differential	$\checkmark$	0
Hybrid	0	0
Sequential Sequential	×	$\checkmark$
DFC <sup>1</sup>	$\checkmark$	$\checkmark$

#### **Deterministic Fuzzy Checkpoints**

- Fuzzy state capture parallel to execution
- Deterministic checkpoint after completion

# Thank you for your attention Ouestions?
